

Grazing Management

A grazing management conservation activity plan is a site-specific strategy to help a landowner improve and sustain rangeland and pastureland resources.

NRCS Technical Service Providers (TSPs) prepare these plans using inputs such as:

- Evaluations of existing and planned plant condition
- Assessments of forage/animal balance
- Analyses of grazing distribution
- Contingency plans for drought, hail, flood, and fire
- Assessments of forage yield, quality, and diversity
- Monitoring plans

Conservation practices recommended by such a plan can include:

- Brush management
- Fencing
- Forage harvest management
- Pasture, hay, and range planting
- Prescribed grazing
- Firebreaks
- Watering facilities
